

Day 11 Setting up DHCP Server

Installing DHCP Server inside of the add roles and features wizard

DHCP custom scope setup, using a custom IP address range, excludes 10.1.10.2 which is my servers static IP, added a lease of 10 days, and used 10.1.10.1 as my default gateway (which is my servers static IP).

From here, I switched over to my lab computer, went into Network/Internet settings, and changed IP settings to use DHCP instead of static IP assignment.

Went into the hypervisor to disable the DHCP Server since we just created one

Day 12 DNS Troubleshooting

Took some time to examine all the DNS records that were created automatically by AD. Seeing these SOA, NS, A, and SRV records was really refreshing because I learned what each one does while studying for CompTIA's A+.

Created an A record

Created a CNAME record also known as an alias for the server just created

Created a reverse lookup zone

Day 13 PowerShell ISE

Going to write various shell scripts to automate tasks inside of AD

Automated the process of creating user accounts using AD specifications. I did use AI to help me write these scripts for time purposes, and to help me get a better understanding of PowerShell ISE documentation.

Test users 1 and 2 were successfully created

Created a .ps1 file so that the creation of user accounts can be automated a lot easier

```
1 $users = @(
2   @{Name="Amy Carter"; Sam="acarter"},
3   @{Name="Brian Lopez"; Sam="blopez"},
4   @{Name="Dana Kim"; Sam="dkim"}
5 )
6
7 foreach ($u in $users) {
8   New-ADUser `
9     -Name $u.Name `
10    -SamAccountName $u.Sam `
11    -UserPrincipalName "$($u.Sam)@alexlang-helpdesk.com" `
12    -Path "CN=Users,DC=alexlang-helpdesk,DC=com" `
13    -AccountPassword (ConvertTo-SecureString "Welcome1!" -AsPlainText -Force) `
14    -Enabled $true
15   Write-Host "Created: $($u.Name)"
16 }
```

Created: Dana Kim

Showing the creation of given user accounts

```
1 $user = "jstevens"
2
3 Set-ADAccountPassword -Identity $user `
4   -Reset `
5   -NewPassword (ConvertTo-SecureString "TempPass99!" -AsPlainText -Force)
6
7 Set-ADUser -Identity $user -ChangePasswordAtLogon $true
8
9 Write-Host "Password reset for $user. Must change at next logon."
```

PS C:\Users\Administrator> C:\Users\Administrator\Downloads\changeUser.ps1
Set-ADAccountPassword : The password does not meet the length, complexity, or history requirement of the domain.
At C:\Users\Administrator\Downloads\changeUser.ps1:3 char:1
+ Set-ADAccountPassword -Identity \$user
+ ~~~~~
+ CategoryInfo : InvalidData: (jstevens:ADAccount) [Set-ADAccountPassword], ADPasswordComplexityException
+ FullyQualifiedErrorId : ActiveDirectoryServer:1325,Microsoft.ActiveDirectory.Management.Commands.SetADAccountPassword

Password reset for jstevens. Must change at next logon.

Wrote a script for password reset as well, now user jstevens must reset there password next time they try to login to thier workstation

Navigating back to AD Users and Groups, it clearly said that the user must change their login meaning the script ran successfully

Wrote one more to get some basic info about the system

Day 14 Ticketing System with OS Ticket

During most of this experiment so far my VM has been on a host-only network connection but I need a network connection to install os ticket so temporally making it a bridge adapter

Installed XAMPP(Apache) so I have a local webserver that os ticket can run on and then installed osTicket on the XAMPP server.

XAMPP Control panel successfully configured, and phpMyAdmin successfully loaded

Created a database, added a user account, and gave that account admin permissions

Had to some around some files around and rename some folders, but finally got setup configured in the right location

☐ JSON.php	PHP File	34 KB
☐ mysqli.php	PHP File	10 KB
☐ ost-config.php	PHP File	7 KB
☐ ost-sampleconfig.php	PHP File	7 KB
☐ Recommended Extensions	PHP File	7 KB

Updated the config file so that the server could find it

Created some general new help topics

Had a problem with the format of the emails I was using to create tickets, so I had to navigate back to the admin panel and uncheck the setting “Require email verification on “Require email verification on ticket status”. That also did not work right away, and it would only accept tickets that.

I got stuck here, and couldn't add any further tickets, will try again later

Observations/Results

- I had issues initially setting up the configuration file because the server could not find it (had to do some file configuration management to fix the location issue)
- I also had issues after trying to install osTicket when the server could find the config file and kept getting a permissions error (The configure file admin did not have the proper permissions)

Day 15 NTFS Permissions and Security

Created a very basic file structure

Created 3 new security groups

Added appropriate users to these groups that have already been created inside of AD.

Went into each folder and adjusted inheritance permissions for HR, IT, Sales, and Public

HR, IT, and Sales staff now have read and execute permissions via NTFs permissions

The public folder is supposed to be accessible by everyone, so I made user everyone has read permissions to it

Gave domain users read permissions, and domain admins full control

Used effective access control to view all security settings of multiple users to get a full overview of permissions

Day 16 Software Deployment through Group Policy

Downloaded 7-Zip on Server controller, and needed to give folder permissions to all domain computers

Created a new group policy object inside of alexlang-helpdesk.com

Package successfully added, ran gpupdate on windows machine, restarted vm, and it auto installed it on that machine

Observations/Results

- I initially installed the wrong version of 7-ZIP, so I had to go back and install the .msi version instead of the .exe version

Day 17 Backup and Recovery

Installed Windows Server Backup from add roles/feature, and opened it

When trying to initially creating a manual backup, my VM did not have enough space, so I created a new VHD within the hypervisor.

After this troubleshooting, I was still unable to make a successful manual backup. For time purposes I decided just to skip this part and to continue forward with the lab.

Time	Message	Description
 5/6/2026 12:54 PM	Backup	Failed
 5/6/2026 12:51 PM	Backup	Failed
 5/6/2026 12:44 PM	Backup	Failed

I did however make several attempts to make the backup, backing it up to different storage devices

Setup automatic shadow copy backups of the C drive for each day at 2pm, and also created a immediate copy.

Created a sample file inside of C:\Shares\Company\Public so I can simulate a real world important file becoming deleted

Went into the folders previous version properties and found the latest version of the folder before testfile.c was deleted.

Observations/Results

- I definitely could've figured out the manual backup problem but with limited time to work on this project, I just decided to bypass it

Day 18 Event viewer and Log Analysis

Observations/Results

Day 19

Observations/Results

Day 20

Observations/Results
